Preface

This publication is intended primarily for use by z/Architecture™ assembler-language application programmers. It contains basic machine information summarized from the *IBM z/Architecture Principles of Operation* (SA22-7832), about the IBM z Systems™ processors. It also contains frequently used information from *IBM ESA/390 Common I/O-Device Commands and Self Description* (SA22-7204), *IBM System/370 Extended Architecture Interpretive Execution* (SA22-7095), *The Load-Program-Parameter and the CPU-Measurement Facilities* (SC23-2260), and *IBM High Level Assembler for z/OS, z/VM & z/VSE Language Reference* (SC26-4940). This publication will be updated from time to time. However, the above publications and others cited in this publication are the authoritative reference sources and will be first to reflect changes.

Notes:

1 For Diagnose, the resulting condition code is model-dependent.

2 For Load Real Address, condition code 3 is set if address-space-control element not available, region-table entry outside table or invalid, segment-table entry outside table, or, for LRA in 24- or 31-bit mode when bits 0-32 of entry address not all zeros, segment- or page-table entry invalid.

3 For Load PSW, Load PSW Extended, and Resume Program, the condition code is loaded from the condition-code field of the second operand.

4 For Set Program Mask, the condition code is loaded from bit positions 2 and 3 of the first operand.

5 For various vector-facility instructions, the condition code is optionally set based on the CS control in the M[5] field of the instruction.

Bit	Meaning when Bit is One
0	The instructions marked "N3" in the instruction-summary figures in Chapters 7 and 10 are installed.
1	The z/Architecture architectural mode is installed.
2	The z/Architecture architectural mode is active. When bits 2 and 168 are both zero, the ESA/390 architectural mode is active; when bit 2 is zero and bit 168 is one, the ESA/390 compatibility mode is active.

IDTE also performs the clearing-by-ASCE operation. Unless bit 4 is one, IDTE simply purges all TLBs. Bit 3 is one if bit 4 is one.
5	INVALIDATE DAT TABLE ENTRY (IDTE) performs the invalidation-and-clearing operation by selectively clearing TLB region-table entries when a region-table entry or entries are invalidated. Bits 3 and 4 are ones if bit 5 is one.

Hexadecimal and Decimal Conversion

Use the following figure to preform hexadecimal and decimal conversions.

From hex: locate each hex digit in its corresponding column position and note the decimal equivalents. Add these to obtain the decimal value.

From decimal: (1) locate the largest decimal value in the table that will fit into the decimal number to be converted, and (2) note its hex equivalent and hex column position. (3) Find the decimal remainder. Repeat the process on this and subsequent remainders.

Note: Hexadecimal equivalents of all numbers from 0 to 255 are listed in "Character Assignments" on page 98.
