

Transport Layer

Internet protocol stack

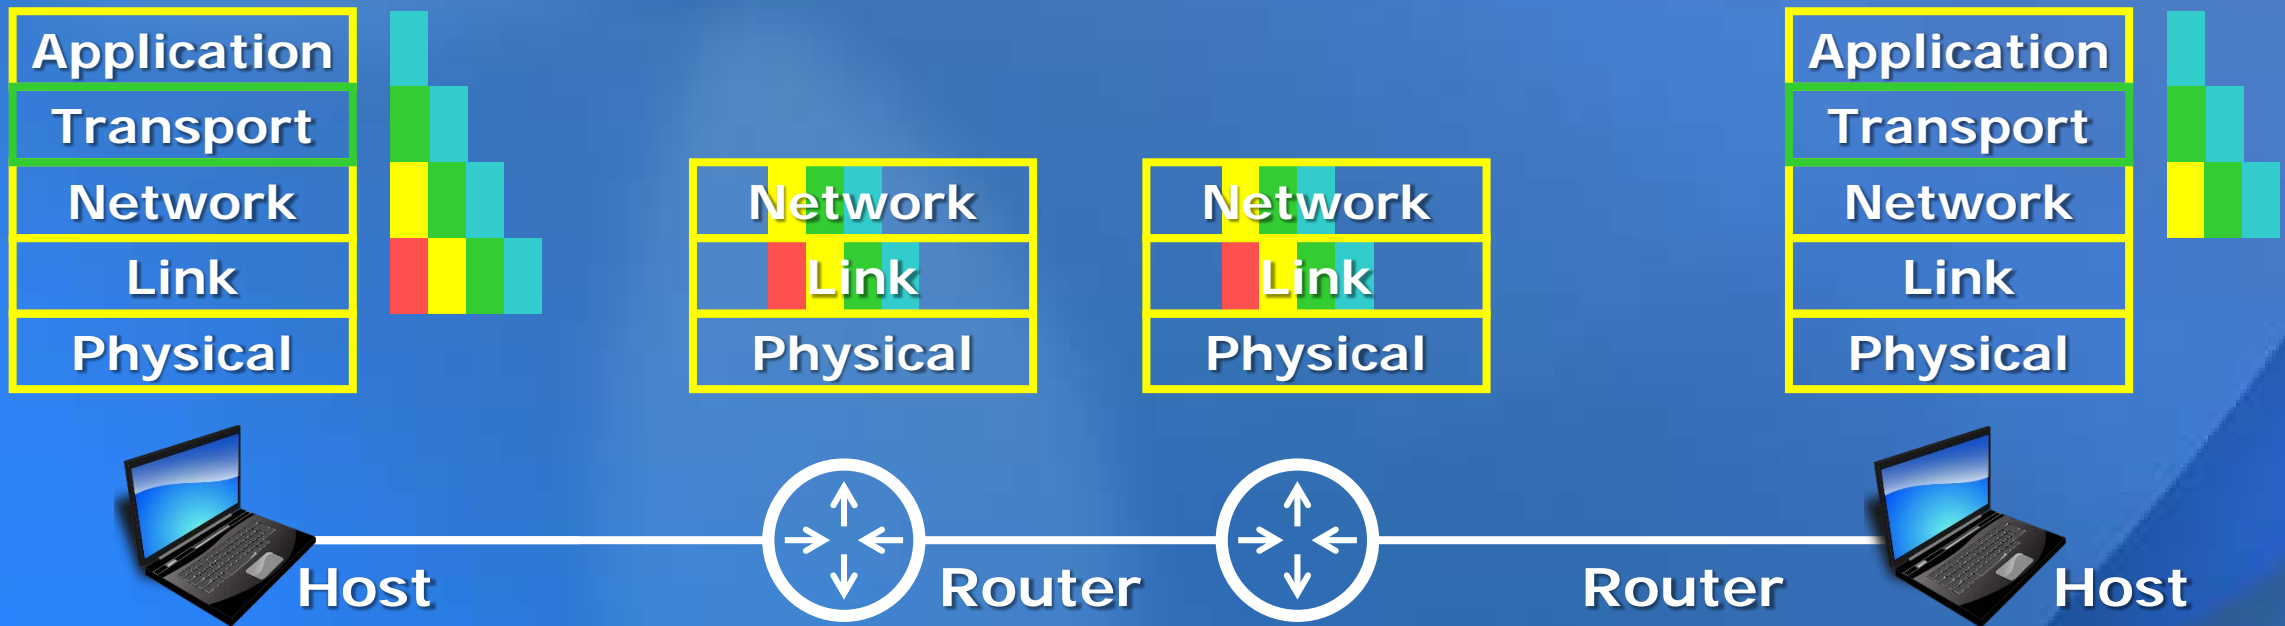

Transport layer

- provides for logical communication between applications (processes) running on different hosts
- runs in end system (host)
- e.g. TCP and UDP

Logical Communication

Transport vs. Network

Network Layer: logical communication between hosts via routers

Transport Layer: logical communication between processes on hosts

Transport-layer protocols

User Datagram Protocol (UDP)

- simple extension of IP in network layer
- segments passed to receiver may be missing or out of order

Transmission Control Protocol (TCP)

- segments passed to receiver reliably and in order
- additional services

Transport layer functions

- Multiplexing/Demultiplexing
 - Error Detection
 - Reliable Data Transfer
 - Flow Control
 - Congestion Control
 - Connection Management
- both UDP and TCP
- by TCP but not UDP
