

IP Protocol Stack

Internet protocol stack

Internet protocol stack

Application Layer

- The applications we run
 - e-mail
 - web browsing
 - instant messaging
 - P2P file sharing
 - multi-user network games
 - video streaming
 - video conferencing
 - Voice over IP
- Runs in hosts

Application architectures

Client-server

- HTTP
- DNS

Peer-to-peer (P2P)

Internet protocol stack

Transport layer

- provides for logical communication between applications (processes) running on different hosts

Functions

- **Multiplexing/Demultiplexing**
- Error Detection
- **Reliable Data Transfer**
- Flow Control
- Congestion Control
- Connection Management

Transport-layer protocols

User Datagram Protocol (UDP)

- simple extension of IP in network layer
- includes error detection
- segments passed to receiver may be missing or out of order

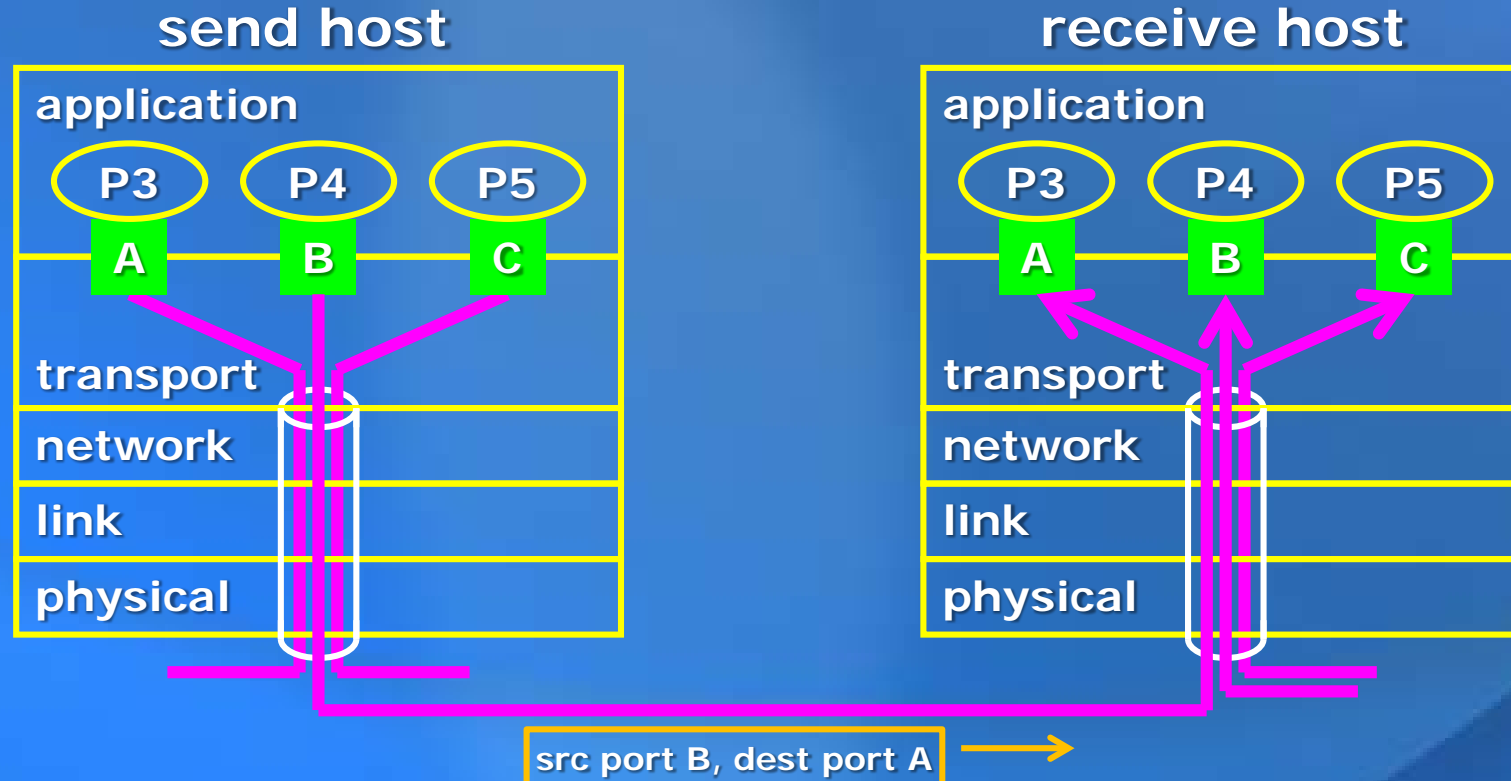

Transmission Control Protocol (TCP)

- segments passed to receiver reliably and in order
- additional services

Multiplexing/Demultiplexing

Send host transport layer gathers messages from multiple sockets

Receive host transport layer delivers segments to correct sockets

Reliable Transport

Stop and Wait

Sliding Window

Internet protocol stack

Network layer

- delivers packets from source to destination over a network
- e.g. Internet Protocol (IP)

Functions

- Encapsulation
- Addressing
- Forwarding
- Routing

IP Addresses

- An IP (Internet Protocol) address is a unique global address for a network interface
- Network interface: connection between host/ router and physical link
 - routers typically have many interfaces
 - host typically has one or two interface (e.g. wired/wireless)

Forwarding

Given best path from node C to every other node

Find forwarding table for node C

dest	A	B	C	D	E	F	G	H	I	J	K	L
output	L1	L1	-	L2	L2	L3	L4	L3	L3	L4	L4	L4

Routing

Find best path
from node A to
every other node

Distance Vector Algorithm

- Decentralized
- Iterative computation via message passing between nearest neighbors

Link State Algorithm

- Global
- All nodes have estimate of network topology
- Message flooding

Internet protocol stack

Link layer

- handles data transfer from one node to a physically adjacent node
- e.g. 802.11 (WiFi)

Services

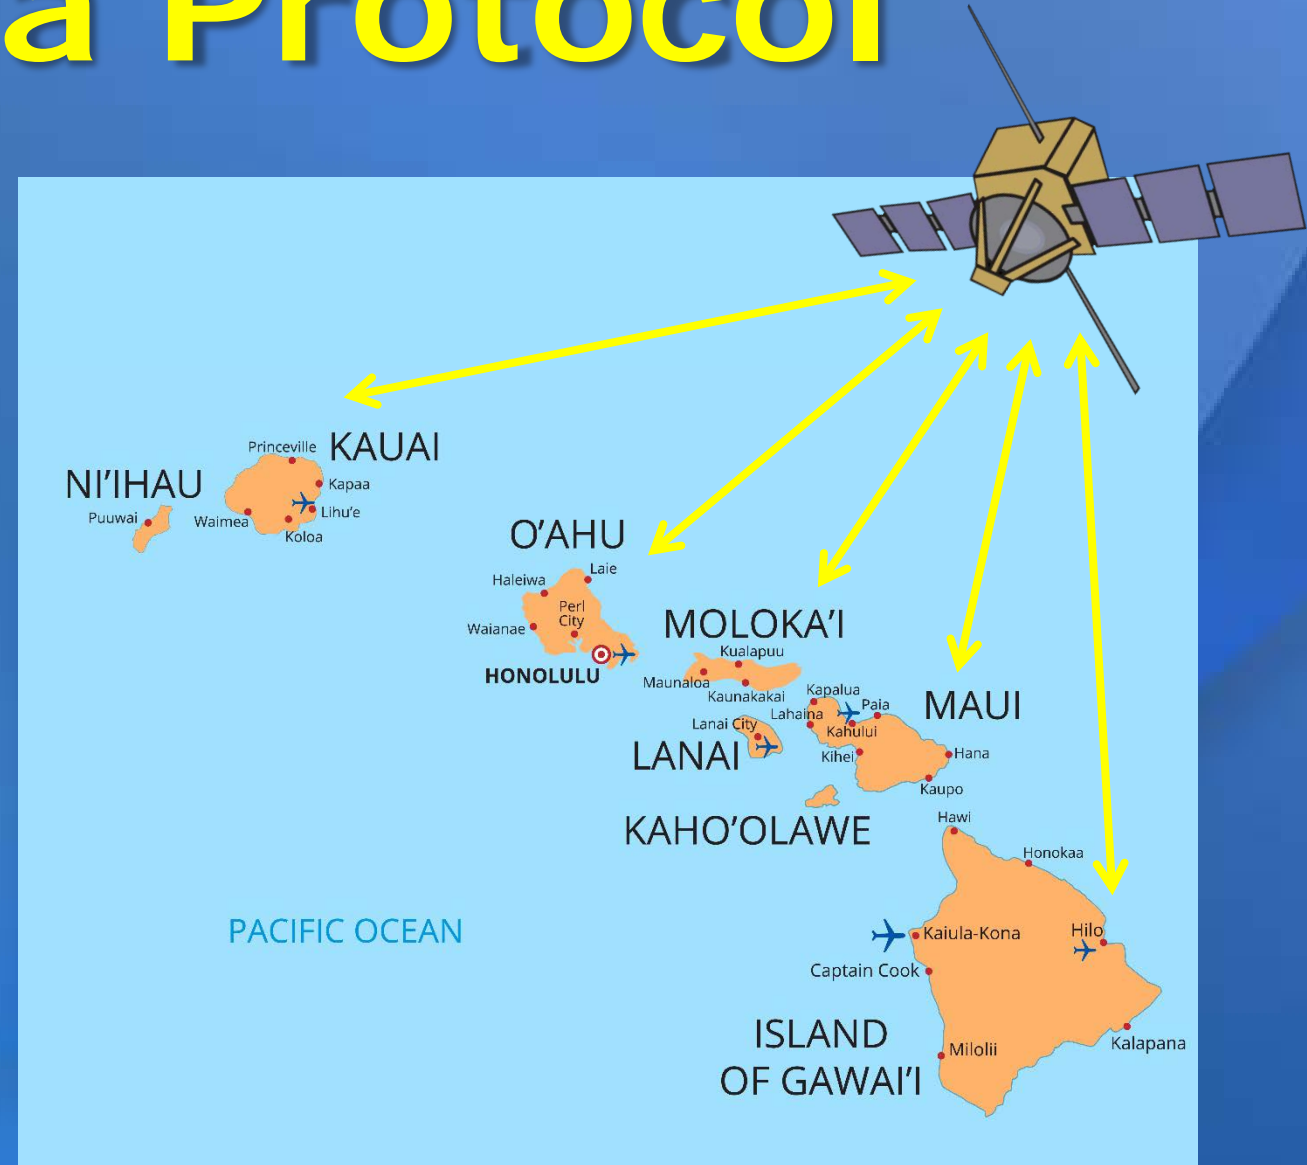

- framing
- error detection/correction
- flow control
- **media access control (MAC)**

The Aloha Protocol

Simple example of a randomized contention protocol.

Each node executes

- If have packet, then transmit.
- If a collision is detected, each node waits a random amount of time before re-transmitting the packet.
- These nodes are said to be **backlogged**.

Efficiency of Slotted Aloha

Efficiency:
The fraction
of time slots
with a
successful
transmission

N = # of nodes

**For max efficiency,
 $p = 1/N$**

**As $N \rightarrow \infty$,
efficiency $\rightarrow 37\%$**

Internet protocol stack

- Application layer runs applications, e.g. email, web browser, messaging
- Transport layer provides for logical communication between applications
- Network layer delivers packets from source to destination over a network
- Link layer handles data transfer from between adjacent nodes
- Physical layer deals with properties of medium (e.g. wired/wireless)
