Computer Networks
A computer network or data network is a telecommunications network which allows computers and other electronic devices to exchange data. To do so they are connected through network links, that can be cabled or wireless.
Computer networks, as any other network, are composed of nodes. In computer networks, a node is an electronic device that is capable of sending, receiving or forwarding data using a communication medium. This way a network is defined as a group of two or more nodes designed to send and receive information sharing hardware and software resources.

In data communication, a physical network node may either be a data communication equipment (DCE) such as a modem, hub, bridge, router or switch; or a data terminal equipment (DTE) such as a digital telephone handset, a printer, a host computer or a server.
